

Export Path Hardening and Test Isolation Pass

CC-TX-2026-05-28-005 | 2026-05-28 | Active Canon

Layer: Session Workspace / Export Reliability

From: Cody Valle

To: Brandon Hatfield, LPC and Gregory

Authorized By: Brandon Hatfield, LPC

Summary

Cody completed a follow-through pass on Paula's draft export work, making the export destination configurable, recording the last exported file URL, and moving export tests out of the real Downloads folder. 'swift build' and 'Tools/run-tests.sh' both pass; the suite now contains 49 tests with 0 failures.

Source Issue: Local implementation record

After Paula completed Pass 4, the export path was functional but still carried a testability problem: export tests wrote real '.txt' files into the user's Downloads folder. Cody tightened the export boundary so production behavior remains unchanged while tests can use isolated temporary directories.

'VaultStore' now accepts an 'exportDirectoryURL' in its initializer, defaulting to Downloads for normal app use. Both 'exportNoteDraft(for:)' and 'exportBackup()' use that configured directory and create it when needed. The store now records 'lastExportedDraftURL' and 'lastBackupURL', giving the app and tests a durable reference to the most recent local export.

The draft export filename path was strengthened with a 'safeFileComponent(_:)' helper so session names are converted into filesystem-safe components. The draft export success alert now names the exported file instead of giving only a generic Downloads confirmation.

The VaultStore export tests now pass an isolated temporary export directory instead of writing to the real Downloads folder. A new test confirms that the exported '.txt' file exists in the configured directory and contains the generated progress note text.

Verification completed with 'swift build' and 'Tools/run-tests.sh'. The full suite reports 49 tests, 0 failures.

Decisions

- Keep Downloads as the default export destination for production behavior.
- Allow tests and future workflows to inject a different export directory.
- Track the last exported draft and backup URLs on VaultStore.
- Keep export alerts human-readable by naming the generated file.
- Avoid using real Downloads during automated tests.

Next Actions

- Start Paula's next substantial pass in a fresh session.
- Assign Paula a bounded Pass 5 only after choosing the next product layer deliberately.
- Consider a future in-app export history surface if exported artifacts become a repeated workflow.
