

Native Alpha Functional Workspace Expansion

CC-TX-2026-06-13-001 | 2026-06-13 | Active Canon

Layer: Native macOS Alpha / Clinical Workflow

From: Cody Valle

To: Brandon Hatfield, LPC and Gregory

Authorized By: Brandon Hatfield, LPC

Summary

Cody advanced the native macOS prototype from a visually strong shell into a broader working alpha, connecting core sidebar areas to real vault-derived workflows and verifying the build with 57 passing tests.

Source Issue: Local implementation record

The June 13 implementation pass focused on making the ConCOREdance alpha feel operational across the full workspace, not merely visually complete. The native SwiftUI shell now routes every primary sidebar section to a functional screen: Home, Session, Calendar, Clients, Notes, Plans, Tasks, Messages, Insights, Resources, and Settings.

The clinical data model gained client-session linkage through an optional session-level client identifier. VaultStore now supports session creation, client-specific session lookup, and persistence for linked sessions. The New Session flow can link a session to an existing client, while client detail screens now show related sessions and allow direct scheduling.

The dashboard and major workspaces were grounded in real vault state. Calendar now shows a working session queue and status counts. Notes reflects actual stored client notes. Plans organizes continuity signals into care-direction cards. Tasks derives an operational queue from scheduled sessions, draft work, ready-for-review artifacts, and client records that need baseline documentation.

Messages and Resources were added as pragmatic alpha surfaces rather than speculative integrations. Messages provides a local contact index and copyable follow-up language derived from session plans. Resources gathers the transmission archive, local project home, encrypted vault path, export folder, and export actions into one operational shelf. Settings

now exposes vault status, storage paths, export history, backup controls, lock controls, and recent audit activity.

The app also received a local build-and-run pathway for faster alpha review. The current build was verified with swift build and the project test runner. The test suite reports 57 tests with 0 failures, covering the new session creation, client linkage, persistence, default continuity signals, and audit behavior.

Decisions

- Treat every visible primary sidebar item as accountable alpha surface area.
- Derive Plans, Tasks, Messages, and Insights from existing vault state before introducing new storage structures.
- Preserve local-first workflow boundaries for contacts, exports, vault location, and archive references.
- Link sessions to clients with an optional client identifier while preserving existing fixture and unlinked-session behavior.
- Keep the alpha visually atmospheric while prioritizing functional clinical navigation.

Next Actions

- Review the full sidebar flow in the running app and identify the highest-friction clinical path.
- Add a stronger search surface across clients, sessions, notes, and continuity signals.
- Decide which alpha workspace should receive the next true write workflow beyond viewing and derived summaries.
- Continue expanding test coverage around user-facing workspace state as the screens become more interactive.
- Prepare a working alpha review sequence for Brandon Hatfield, LPC and Gregory.
